Introduction

The UT Container Management Platform (UT CMP) service, built as a result of the 2021-2022 [Next Generation Platform \(NGP\) Project](#), is an on-premise application deployment and hosting platform for university applications. UT CMP was designed to provide the equivalent functionality of PyPE (Python Production Environment) in a modern, secure, and reliable environment using the Kubernetes-based platform, Rancher.

What you need to know to use the service

To use UT CMP, you or someone in your department will need to know how to:

- containerize an application using Docker (a.k.a. Dockerize)
- use GitHub (and have a UT Austin enterprise GitHub organization account and repository)
- manage Active Directory (AD) groups
- use Splunk to view/filter logs
- build applications that follow the [university's secure development and related IT policies, procedures, and guidelines](#)

Interacting with UT CMP

Developers will interact primarily with UT CMP through their local development and GitHub; they can log in to Rancher and Harbor to view images and logs, and Backstage is a "single pane of glass" into deployments.

Developer access to UT CMP is managed through AD groups that contain the EIDs of developers who are authorized to deploy to the staging and/or production project spaces in Rancher. Another AD group is required to access the UT CMP logs in Splunk.

How to use the UT CMP documentation

- The [UT CMP Getting Started](#) section provides detailed, step-by-step instructions for how containerize your application, sign up for UT CMP, set up your GitHub organization and repositories to use UT CMP, and to deploy an application.
- The [UT CMP Service Management](#) section provides documentation about managing various aspects of the deployment and interacting with UT CMP components for the continued support of your applications.
- The [UT CMP Troubleshooting](#) section is a collection of troubleshooting tips and tricks compiled by the UT developer community and the service team.
- Refer to the [UT CMP Training and Resources](#) section to learn more about the tools that comprise UT CMP.
- Learn how to add pages, update pages, or tag pages that need updates to documentation in [UT CMP Wiki Tools](#).
- Visit [UT CMP Service Announcements and Maintenance Events](#) for a history of maintenance for the service.
